Current/Most Recent Employer

Currently work at London School of Hygiene & Tropical Medicine: No			
Employer's Name: London Business School		**Job Title:** Interim Treasury Analysis	
Location: London	**Salary:** 31,000	**Start Date:** 01/2026	**Ongoing**
Employment Type: Another HEI in UK		**HEI:** London Business School	

Brief Description of Duties: Managed daily cashflow reporting for senior management to support decision-making.

Ensured sufficient liquidity for BACS, priority and internation payments.

Monitored and resolved rejected payments via HSBCnet, preventing delays and escalation.

Used TechnologyOne extensively for bank reconciliations, identifying and correcting historical and current journals and managed cash allocation and processed daily banking payments.

Processed non-PO payments and invoices, posted journals in line with financial controls.

Reasons For Leaving/ Wishing To Leave: Secondment within the School's Fianance Department	**Notice Period:** 1 month

Previous Employment

Employer's Name: London Business School	**Job Title:** Accounts Receivable Officer (Credit Control Analys	
Location: London	**Start Date:** 07/2025	**Ongoing**
Brief Description of Duties: Managed credit control activities across Executive Education and Degree Education Programmes, supporting cash flow and financial operations. Utilised TechnologyOne to process invoices and credit notes, maintain data integrity and produce reports for analysis and forecasting. Collaborated with internal and external stakeholders to resolve account queries and maintain strong student relationships, enhancing the school's reputation. Supported compliance, reconciliations and audit requirements.		
Reasons For Leaving: Secondment to Treasury Analysis		
Employer's Name: London Business School	**Job Title:** Finance Systems Administrator	
Location: London	**Start Date:** 02/2025	**End Date:** 07/2025
Brief Description of Duties: Provided first-line operational support for finance systems to approximately 50 Finance Department users and over 650 staff across the wider organisation, ensuring prompt resolution of system issues and service requests. Managed and triaged finance system support requests through shared mailboxes and the Hornbill Service Desk, escalating issues where appropriate and monitoring cases through to successful resolution. Acted as a key administrator for TechnologyOne and Infor Expenses Management (XM), maintaining user accounts, access permissions, authorisations, approval hierarchies, cost centres, creditor records and standing data. Administered user access rights and system permissions in accordance with organisational controls, approval structures and financial governance requirements. Supported the maintenance of finance system workflows, ensuring purchasing, invoicing and expense approval processes progressed efficiently through established approval routes. Maintained finance system master data, including chart of accounts structures, cost centres and organisational hierarchies, ensuring accuracy and consistency across systems. Provided expert user support and guidance for Procure-to-Pay (P2P), Accounts Payable and expenses management processes, resolving workflow, reimbursement and invoice processing queries. Worked closely with Finance teams to identify system issues, support process improvements and ensure finance systems continued to meet operational requirements. Assisted with the administration and ongoing maintenance of Software-as-a-Service (SaaS) finance systems ensuring data integrity and effective day-to-day operation. Developed strong working knowledge of TechnologyOne Financials and associated finance system processes within a higher education environment.		
Reasons For Leaving: Secondment to Credit Control Analysis		
Employer's Name: Project Recruit	**Job Title:** Operations & Payroll Support Manager	

Location: London	**Start Date:** 07/2023	**End Date:** 01/2025
Brief Description of Duties: Led and managed a team of 8, conducting regular 121 meetings and ensuring performance and service delivery. Managed recruitment, payroll and operational processes for a major US media client. Nominated as System Administrator (Voyage, Monday.com, Xero), responsible for system governance, user support and process improvements. Acted as the escalation point for payroll, compliance and client service issues, working closely with HR, Finance and senior stakeholders.		
Reasons For Leaving:		
Employer's Name: Bromley London Borough Council	**Job Title:** Property Data Officer	
Location: London	**Start Date:** 03/2023	**End Date:** 07/2023
Brief Description of Duties: Record site and building measurements, verifying them against the internal system using online GIS mapping tools on Concerto. Input both automated and manual data for property migration within the council to support the implementation of new databases. Collaborate with colleagues across the council, including the Legal and Housing teams, to gather, review, and update information		
Reasons For Leaving:		
Employer's Name: Galago Group	**Job Title:** Client Operations Manager	
Location: London	**Start Date:** 06/2017	**End Date:** 03/2023
Brief Description of Duties: Led a team of 3 and oversaw business systems (Aspire and Tempest), reporting and operational processes. Managed data governance, KPI/Mi reports and board-level business intelligence. Designed and implemented process improvement, compliance controls and risk management framework. Partnered with senior stakeholders to drive operational efficiency, resolve issues, and maintain client compliance.		
Reasons For Leaving:		
Gaps in Employment History: N/a

(To enter scores use the "Selection Criteria" tab)

1. (Essential to the job) Can you describe your relevant professional qualifications or the experience you have gained that prepares you for this role? Please elaborate on your educational qualification and/or relevant experience with examples.
My most relevant experience is my current role at London Business School, where I have progressed through several finance focused positions, most recently as Interim Treasury Analyst. In this role, I manage daily cashflow reporting for senior stakeholders, ensuring sufficient liquidity for BACS, priority and international payments. I work extensively with TechnologyOne Financials to perform bank reconciliations, correct journals, and process payments, ensuring accuracy and compliance with financial controls. I also monitor and resolve rejected payments via HSBCnet, preventing delays and maintaining smooth treasury operations. Previously, as a Finance Systems Administrator at London Business School, I provided first-line support for finance

systems used by over 650 staff, resolving system issues and service requests through a structured helpdesk process. I administered user access, permissions, approval hierarchies, and master data such as cost centres and chart of accounts structures, ensuring data integrity and compliance with financial governance requirements. I also supported Procure-to-Pay, Accounts Payable and expenses processes, helping users resolve workflow and system issues efficiently. This role gave me strong hands-on experience in ERP system support, particularly with TechnologyOne Financials and Infor Expenses Management.

In addition, my experience as Accounts Receivable Officer strengthened my understanding of financial operations, credit control and reporting. I used TechnologyOne to process invoices and credit notes, maintain accurate data, and produce reports to support forecasting and analysis. I also worked closely with internal and external stakeholders to resolve account queries and support reconciliations and audit requirements.

2. (Essential to the job)
Describe your experience in delivering first-line operational IT support, particularly within a higher education environment. Please share examples from your previous roles to support your statement.

As a Finance Systems Administrator at London Business School, I delivered first line operational IT support for finance systems used across a large higher education environment, supporting approximately 50 Finance users and over 650 staff across the wider organisation. I was responsible for managing and resolving a high volume of system related queries received through shared mailboxes and the Hornbill Service Desk ticketing system, ensuring issues were logged, prioritised, and resolved within agreed service standards.

A key part of my role involved first-line support for TechnologyOne Financials and Infor Expenses Management (XM). I routinely set up new users, provisioned users with access permissions, and assigned appropriate cost centres, ensuring users had the correct access aligned with their role and financial approval responsibilities. I also supported the creation and maintenance of approval hierarchies, standing data, and organisational structures to ensure smooth system functionality and compliance with internal financial controls.

In addition to user setup, I provided day-to-day troubleshooting support for issues such as login problems, workflow failures, invoice processing errors, and expense claim queries. For example, I would investigate rejected or delayed transactions in TechnologyOne or HSBCnet, identify the root cause, and either resolve the issue directly or escalate it to the appropriate technical or system support team while ensuring users were kept informed throughout the process.

Requests were received through multiple channels, including email and the Hornbill ticketing system, and I ensured all cases were tracked, prioritised, and resolved in line with service expectations. Where recurring issues were identified, I worked closely with Finance and IT teams to identify root causes and implement process improvements to reduce future incidents.

My previous experience in operational and systems-focused roles, including as Operations & Payroll Support Manager, further strengthened my IT support capability. I acted as system administrator for platforms such as Xero and Monday.com, providing user support, managing access, and resolving operational issues, often acting as the first point of contact for system related queries.

Overall, my experience has given me strong first-line IT support skills within a complex, high-volume environment, with a strong focus on finance systems, user support, and maintaining data integrity within a higher education setting.

3. (Essential to the job)
Please share examples/instances from your previous roles where you worked within structured environments, and how do you approach using technical documentation in your daily work?

In my current and previous roles, I have consistently worked within structured, controlled environments where processes, documentation, and governance frameworks are essential to ensuring accuracy, compliance, and continuity of service particularly within finance systems and higher education operations at London Business School.

In my role as Finance Systems Administrator at London Business School, I worked within clearly defined ITIL-style service management processes using the Hornbill Service Desk system. All incidents and service requests were logged, prioritised, and managed through structured workflows with defined service expectations. I followed established procedures for user access management, approval hierarchies, and master data maintenance within

TechnologyOne Financials and Infor Expenses Management. For example, when setting up new users or adjusting cost centre access, I ensured changes were made in line with documented approval structures and financial governance controls, with appropriate authorisation recorded before implementation.

Similarly, when supporting system issues such as failed workflows or expense claim errors, I worked within escalation pathways, ensuring issues were either resolved at first line using documented procedures or escalated with full technical detail and evidence to IT or system vendors. This structured approach ensured consistency, auditability, and minimal disruption to finance operations.

In my Interim Treasury Analyst role, I also operate within structured financial controls and banking procedures. Daily cash management, payment processing, and bank reconciliation activities are carried out in line with strict financial timelines and approval processes. For instance, when managing rejected payments via HSBCnet, I follow documented investigation steps to identify root causes and apply corrective actions while maintaining an audit trail.

Regarding technical documentation, I use it as a key reference point in my daily work to ensure accuracy and consistency. I regularly consult system user guides, internal SOPs, and configuration documentation when performing tasks such as user provisioning, workflow troubleshooting, and system maintenance. When encountering unfamiliar issues, I use documentation to understand system behaviour and verify correct procedures before taking action. I also contribute to improving documentation by identifying gaps or unclear instructions and feeding this back to senior colleagues or system owners, helping to enhance usability for the wider team.

Overall, my approach is structured, evidence-based, and documentation-led, ensuring that all system support activities are carried out consistently, securely, and in line with organisational standards.

4. (Essential to the job)
Please share examples/instances from your previous roles where you have gathered and interpreted customer requirements and translated them into practical solutions

In my roles within finance systems and operational support at London Business School and in previous organisations, I have regularly gathered, clarified, and translated user requirements into practical system and process solutions, ensuring they were aligned with operational needs and financial controls.

As a Finance Systems Administrator at London Business School, a key part of my role involved working directly with Finance, Procurement, and wider business users to understand their requirements for system access, workflow changes, and reporting needs within TechnologyOne Financials and Infor Expenses Management. For example, when departments requested changes to approval hierarchies or cost centre access, I would first gather detailed requirements through email discussions or service desk tickets, clarifying the business need, user roles involved, and the intended financial control outcomes. I then translated these requirements into system configurations by updating approval workflows, adjusting user permissions, or amending standing data, ensuring the solution aligned with governance rules and was fully tested before release.

In another example, users frequently raised issues where expense claims or purchase order workflows were not progressing as expected. I would investigate the issue, interpret the user's description of the problem, and map it against system configuration and process documentation. In many cases, I identified that the issue was caused by incorrect cost centre allocation or missing approval routing. I then implemented corrective actions, such as updating user profiles or adjusting workflow rules, and communicated the resolution clearly back to the user in non-technical language.

As an Accounts Receivable Officer, I also gathered requirements from internal stakeholders and external customers (students and programme teams) to resolve billing and invoicing queries. For instance, when discrepancies arose on invoices, I would clarify the underlying issue, check transaction history in TechnologyOne, and ensure corrections were made so that invoices reflected the correct programme and payment terms. This improved accuracy and strengthened stakeholder confidence in the finance process.

5. (Essential to the job)
Elaborate on your knowledge of finance system configurations, including user access rights, process workflows and reporting. Please share examples of how have you applied this knowledge in your previous roles.

I have strong practical knowledge of finance system configuration gained through hands-on administration of ERP platforms, particularly TechnologyOne Financials and Infor Expenses Management (XM) at London Business School. My experience covers user access controls, workflow configuration, and maintaining data structures that support accurate financial reporting and compliance.

In my role as Finance Systems Administrator, I was responsible for configuring and maintaining user access rights across finance systems used by over 650 staff. This included creating and updating user profiles, assigning role-based permissions, and ensuring access was aligned with organisational approval structures and financial governance requirements. For example, when new staff joined or moved departments, I would review their role and responsibilities, then assign appropriate access to modules such as Accounts Payable, Purchasing, and Expenses, ensuring segregation of duties was maintained and sensitive financial data was appropriately restricted.

I also managed approval workflows within TechnologyOne and Infor XM. This involved configuring and maintaining approval hierarchies for purchase orders, invoices, and expense claims, ensuring that transactions were routed correctly based on cost centre, value thresholds, and departmental structure. When workflow issues arose such as invoices being incorrectly routed or stuck in approval chains I would investigate the user access configuration, identify the breakdown (often due to incorrect user setup or missing cost centre approver mapping), and correct the workflow settings or user assignments to restore proper processing.

In addition, I maintained key financial system data structures, including cost centres, supplier and customer records, chart of accounts elements, and organisational hierarchies. This ensured consistency across the system and supported accurate financial reporting. For instance, when departments were restructured or new cost centres were introduced, I updated system configurations to reflect these changes, ensuring transactions were coded correctly and reporting remained accurate.

My experience also extends to supporting financial reporting processes. As part of my work in both Accounts Receivable and Treasury, I used TechnologyOne to extract and validate financial data, reconcile accounts, and support cashflow and debtor reporting. I ensured that underlying system configuration and data integrity were correct so that reports produced were reliable and could be used confidently by senior management for decision-making.

Across all these responsibilities, I have developed a strong understanding of how system configuration directly impacts financial processes, controls, and reporting accuracy. My approach is detail-focused and control-driven, ensuring that user access, workflows, and system data are configured correctly, maintained consistently, and aligned with both operational needs and governance standards.

6. (Essential to the job)
How have you applied case and issue management techniques in your previous roles? Please share examples

In my current organisation, at London Business School and previous employments, I have regularly applied structured case and issue management techniques to ensure finance system and operational issues are logged, prioritised, investigated, resolved, and documented in a controlled and auditable way.

As a Finance Systems Administrator at London Business School, I used the Hornbill Service Desk system to manage all finance-related incidents and service requests. Every issue was logged as a case, categorised based on impact and urgency, and then tracked through to resolution. I followed a structured approach of triage, investigation, resolution, and closure, ensuring users were kept informed throughout the process and service levels were maintained.

For example, when users reported issues such as invoices not progressing through approval workflows in TechnologyOne or expense claims being rejected in Infor XM, I would first assess the ticket to understand the symptoms and business impact. I would then investigate the case by reviewing workflow configuration, user access rights, and transaction history to identify the root cause. In many cases, issues were linked to incorrect approval routing or missing cost centre assignments. Once identified, I would implement a fix such as updating user permissions, correcting standing data, or adjusting workflow hierarchies and then retest the process before closing the case with a clear explanation to the user.

I also applied issue management techniques for recurring or system-wide problems. For instance, when multiple users reported similar issues, I would analyse patterns across tickets to identify underlying systemic causes rather than treating each incident in isolation. I would then escalate these to IT or system vendors with full diagnostic details, ensuring a faster resolution and reducing repeat incidents. Where appropriate, I also contributed to root

cause analysis and implemented preventative measures, such as updating internal procedures or improving user guidance.

In addition, in my Interim Treasury Analyst role, I manage operational issues related to payments and cash flow. For example, when payments are rejected via HSBCnet, I follow a structured investigation process to identify the cause, whether it is incorrect bank details, formatting issues, or approval delays. I then coordinate corrective action and ensure successful reprocessing, maintaining an audit trail throughout.

Across all roles, I have used a disciplined case management approach: logging issues accurately, prioritising based on impact, investigating systematically, communicating clearly with stakeholders, and ensuring full resolution and documentation. This has helped maintain service continuity and improve system reliability in a high-volume finance environment.

7. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to work as part of a team, understanding team dynamics and showing a flexible approach to team delivery and achievement of team and individual objectives. Can you describe how you contribute to team success and adapt your approach to support team objectives?

Throughout my roles, I have consistently worked as part of cross-functional teams, adapting my approach to support team objectives, share knowledge, and contribute to overall service delivery particularly in fast-changing and high-pressure environments.

At London Business School, I joined the Finance Systems team at the go-live stage of their new ERP system, TechnologyOne. At that time, the team structure consisted of myself, a permanent staff member, and a Senior Manager, both of whom were still developing their understanding of the system. I had been exposed to and trained on TechnologyOne approximately two months before they joined, which placed me in a position where I had relatively stronger practical knowledge of the system during a critical transition period.

Recognising the importance of team capability during the implementation phase, I proactively shared my knowledge with the wider team. I supported onboarding by explaining system functionality, demonstrating key processes such as user setup, approval workflows, and finance transactions, and helping to troubleshoot issues as they arose. I also provided informal training and guidance to both colleagues, ensuring they were able to gain confidence in using the system effectively in their roles.

Beyond the immediate team, I also supported wider Finance users across the organisation at a time when confidence in the new system was still developing. Many staff were uncertain about TechnologyOne during the early stages of rollout, and there was a high volume of queries and operational issues. I adapted my working style to meet this demand by remaining highly responsive, patient, and solution-focused, often re-explaining processes and guiding users step-by-step to help them navigate the system successfully.

By taking a collaborative and flexible approach, I contributed to stabilising system adoption during a challenging period. As a team, we worked closely to resolve issues quickly, improve documentation, and build trust in the system across the organisation. My willingness to step into a knowledge-sharing role helped strengthen team capability and ensured continuity of service during a critical transition phase.

In addition to this, in my previous roles such as Operations & Payroll Support Manager, I led a team of eight, where I regularly adapted my approach depending on workload, priorities, and individual strengths. I held regular one-to-one meetings, delegated tasks based on capability, and ensured the team remained aligned to shared objectives while still supporting individual development needs.

Overall, I contribute to team success by being collaborative, adaptable, and proactive in sharing knowledge. I focus on understanding team dynamics, supporting colleagues where needed, and ensuring that both team and organisational objectives are achieved effectively, even in periods of change or uncertainty.

8. (Essential to the job)
Please share examples/instances from your previous roles where you were able to set and maintain self-determined deadlines aligned to meeting system and user needs. How do you prioritise your workload and ensure deadlines are met when supporting system and user needs?

In my roles at London Business School and previous organisations, I have regularly worked in environments where I needed to set my own priorities and manage competing demands, while still ensuring that system support, finance operations, and user needs were met within required timeframes.

As a Finance Systems Administrator at London Business School, I was responsible for managing a continuous flow of service requests and incidents through the Hornbill Service Desk, alongside scheduled system maintenance tasks such as user access provisioning, cost centre updates, and workflow adjustments in TechnologyOne and Infor Expenses Management. Many of these tasks did not have fixed deadlines set by others, so I had to self-manage and prioritise based on urgency, financial impact, and operational risk.

For example, urgent issues such as payment processing errors, blocked approval workflows, or users unable to access critical finance systems were always prioritised first, as these directly impacted business operations such as supplier payments or expense reimbursements. In contrast, lower priority tasks such as routine access amendments or minor data updates were scheduled around peak processing periods, ensuring they did not disrupt high-volume financial cycles such as month-end processing.

I also managed deadlines for system-related tasks linked to finance operations. For instance, during payment runs or banking cut-off times, I had to ensure that issues affecting transactions in TechnologyOne or HSBCnet were resolved within very tight timeframes. If a payment was rejected, I would immediately investigate the root cause, correct any data or configuration issues, and ensure the payment was reprocessed before banking deadlines to avoid delays or financial disruption.

In addition, I regularly balanced reactive support work with planned system administration tasks. To manage this effectively, I would assess incoming tickets at the start of each day, categorise them by urgency and impact, and plan my workload accordingly. I used a structured approach of "urgent vs important" prioritisation, while also communicating clearly with stakeholders if timelines needed to be adjusted or if additional information was required.

In my Interim Treasury Analyst role, I also operate under strict daily deadlines, particularly for cashflow reporting and payment processing. I ensure that reports are completed on time for senior management review and that banking activities are completed within cut-off times. This requires careful planning of tasks throughout the day and close attention to dependencies, such as reconciling bank transactions before initiating payment runs.

Across all roles, my approach to workload management is structured and proactive. I prioritise based on business impact, financial risk, and operational deadlines; I maintain visibility of all open tasks through tracking systems; and I communicate early if there is any risk to timelines. This ensures that both system stability and user needs are consistently met, even in high-pressure environments.

9. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to operate within, and contribute positively towards, the maintenance of a welcoming and inclusive operational environment.

In my roles across finance systems, operations, and higher education environments, I have consistently contributed to maintaining a welcoming, respectful, and inclusive operational culture by ensuring users feel supported, listened to, and confident when engaging with systems and support teams.

At London Business School, I worked as part of a Finance Systems team supporting over 650 staff with varying levels of technical and financial systems knowledge. Users ranged from senior academics and executive education teams to administrative and finance staff, many of whom were not familiar with systems such as TechnologyOne Financials and Infor Expenses Management. I recognised early that confidence in the system varied significantly, especially during the implementation and early adoption stages.

To support an inclusive working environment, I adapted my communication style depending on the user's level of understanding. When assisting non-technical users, I avoided jargon and instead provided clear, step-by-step guidance, often walking them through processes such as expense claims, invoice approvals, or access requests in a patient and supportive manner. This helped ensure that all users, regardless of technical ability, were able to use the system effectively and felt comfortable asking for help.

During my time supporting the post-implementation period of TechnologyOne at my current workplace, there was uncertainty and hesitation across parts of the organisation. I contributed positively by being approachable and responsive, taking time to explain system functionality and reassure users who were unfamiliar with new

processes. This helped reduce frustration and resistance to change, and supported a more positive overall user experience during a challenging transition period.

I also supported inclusivity within my immediate team by actively sharing knowledge and assisting colleagues who were still developing their understanding of the system. For example, I provided informal training and guidance to team members, ensuring they were able to confidently support users and contribute effectively to team delivery.

In previous roles, such as Operations & Payroll Support Manager, I led a diverse team of eight people. I promoted an inclusive environment by holding regular one-to-one meetings, encouraging open communication, and ensuring that each team member felt supported in their development. I adapted my leadership style based on individual needs, recognising that different team members required different levels of guidance and autonomy.

Across all roles, I have contributed to an inclusive operational environment by being respectful, patient, and adaptable in my approach. I focus on ensuring that all users and colleagues feel valued and supported, and that systems and processes are accessible and usable for people with different levels of experience and confidence.

Current/Most Recent Employer

Currently work at London School of Hygiene & Tropical Medicine: Yes			
Employer's Name: London School of Hygiene and Tropical Medicine		**Job Title:** System Support	
Location: Remote	**Salary:** Day Rate	**Start Date:** 05/2026	**End Date:** 07/2026
Brief Description of Duties: I am currently employed as a contractor at LSHTM, supporting the organisation's migration to TechOne. My primary responsibilities include managing the service desk, reviewing incoming tickets, and ensuring that issues are resolved promptly and effectively. In addition, I monitor outstanding tasks assigned to end users and proactively provide support and guidance to help them complete these activities. I also develop training materials and user documentation to support staff in becoming familiar with the new TechOne system and to facilitate a smooth transition.			
Reasons For Leaving/ Wishing To Leave: My contract will be ending at the end of July.		**Notice Period:** N/A	

Previous Employment

Employer's Name: University of Bradford	**Job Title:** ERP Project Coordinator	
Location: Remote	**Start Date:** 02/2024	**End Date:** 04/2026
Brief Description of Duties: I was coordinating the implementation of a University-wide Enterprise Resource Planning (ERP) system within the HR and People department. After 11 months in the role, I was promoted to Overall ERP Project Coordinator, working closely with the Project Manager and expanding my remit to include Finance alongside HR and Payroll, ensuring effective cross department coordination and a successful system go-live.		

My key responsibilities include:

• Coordinating project activities across HR, Payroll, and Finance to ensure alignment and delivery against milestones.
• Creating and managing project plans, timelines, and trackers to monitor progress and dependencies.
• Organising project meetings, preparing agendas, and producing detailed minutes and action logs.
• Managing project documentation and maintaining a central SharePoint site for key project resources.
• Tracking project risks, issues, and interdependencies across multiple workstreams.
• Supporting system testing by writing and executing test scripts and coordinating user testing activities.
• Ensuring stakeholders meet project deadlines and deliverables.
• Supporting project governance through attendance and reporting in project board meetings.
• Coordinating consultancy sessions and scheduling key project activities across teams.
• Documenting future requirements and ideas for Phase 2 of the project.

My role has evolved to include wider project activities such as:

• Monitoring and triaging support tickets raised by the wider business, resolving bugs/issues where possible without escalation to SMEs.
• Ensuring tickets raised with the provider are acknowledged and worked on in a timely manner.
• Managing user access to the new ERP system, including assigning and updating roles and profiles.
• Scheduling environment refreshes for both Live and Test systems to ensure data accuracy and support effective testing.
• Writing and executing test scripts across multiple project workstreams.
• Creating clear and accessible user documentation, including written user guides and video tutorials to support system adoption.

Reasons For Leaving: My contract came to an end.

Employer's Name: CBES Ltd Manchester	**Job Title:** Service Co-Ordinator	
Location: Oldham	**Start Date:** 09/2022	**End Date:** 02/2024

Brief Description of Duties: I was a service coordinator at CBES Ltd. This job role faces many different challenges daily. I
collaborate closely with my colleagues to ensure the service we provide is of a high standard. I manage my own set of engineers with a delegated area. I also have to take part in meetings and deal with customers over the phone. On a day-to-day basis I deal with incoming jobs from customers and delegate these out to the relevant person/engineer. I also have to ensure jobs are completed before the deadline and communicate this back and forth with customers to make sure they're happy with our response.

Whilst working at CBES as a service coordinator, we implemented a new system throughout the business which I took part in. I was asked to test out the new system before others to make sure it was suitable for business as usual, and to pinpoint any faults and flaws so they could be rectified before we went live.

I also had to attend meetings with senior team leaders to assess the new system we were implementing and provide me opinion on how we could improve/change how we work to best suit the system. I also assisted in training my other work colleagues on how to navigate around the new system and ensure they were ready to go live.

Reasons For Leaving: A better opportunity came up.

Supporting Statements

(To enter scores use the "Selection Criteria" tab)

1. (Essential to the job)
Can you describe your relevant professional qualifications or the experience you have gained that prepares you for this role? Please elaborate on your educational qualification and/or relevant experience with examples.

I have gained significant experience in project coordination and enterprise system implementation through my previous role supporting the delivery of a University-wide Enterprise Resource Planning (ERP) system. Initially appointed to coordinate the HR and People workstream, I was promoted after 11 months to Overall ERP Project Coordinator, expanding my responsibilities to include Finance alongside HR and Payroll. In this role, I work closely with the Project Manager to ensure effective cross-functional coordination and the successful delivery of key project milestones.

My responsibilities include developing and maintaining project plans, coordinating activities across multiple departments, organising meetings, preparing agendas and action logs, and monitoring risks, issues, and dependencies across workstreams. I also support project governance by contributing to project board meetings and ensuring stakeholders meet agreed deadlines and deliverables.

In addition, I have developed strong technical and analytical skills through supporting system testing activities. This has involved writing and executing test scripts, coordinating user acceptance testing, managing system access and permissions, scheduling environment refreshes, and resolving issues raised by users wherever possible. I regularly monitor and triage support tickets, liaise with the system provider to ensure timely resolution of issues, and help maintain the smooth operation of both live and test environments.

A key aspect of my role has been supporting organisational change and user adoption. I have created user guides and video tutorials, maintained project documentation and SharePoint resources, and provided ongoing support to end users to ensure they are confident in using the new system. I have also documented future requirements and enhancements for subsequent phases of the project.

These experiences have strengthened my skills in project coordination, stakeholder management, problem-solving, communication, and delivering change across complex environments. They have equipped me with the ability to manage competing priorities, work collaboratively with a wide range of stakeholders, and contribute effectively to the successful delivery of large-scale projects.

2. (Essential to the job)
Describe your experience in delivering first-line operational IT support, particularly within a higher education environment. Please share examples from your previous roles to support your statement.

I have extensive experience providing first-line operational IT support within a higher education environment through my previous role supporting the implementation of a University-wide Enterprise Resource Planning (ERP) system. As Overall ERP Project Coordinator, I act as a key point of contact for staff across HR, Payroll, and Finance, ensuring that system issues are resolved promptly and that users receive the support they need to work effectively.

A significant part of my role involves monitoring and triaging support tickets raised by the wider business. I investigate and resolve issues wherever possible without the need for escalation and work closely with the system provider and subject matter experts to ensure more complex issues are acknowledged and addressed in a timely manner. This has enabled me to develop strong troubleshooting and problem-solving skills while maintaining a high standard of customer service.

I also manage user access to the ERP system, including creating and updating roles and permissions to ensure users have the appropriate access required to perform their duties. In addition, I coordinate environment refreshes for both test and live systems to support system integrity and facilitate effective testing activities.

To support a smooth transition to the new system, I have produced a range of user-focused documentation, including written guides and video tutorials, and have provided one-to-one support and training to colleagues. This has helped increase user confidence and improve system adoption across the University.

Working within a higher education environment has given me experience of supporting a diverse range of stakeholders, including academic and professional services staff, each with varying levels of technical knowledge. I understand the importance of providing clear, accessible communication and delivering a responsive and

customer-focused service. My ability to prioritise competing demands, manage support requests effectively, and build positive relationships with users has enabled me to contribute to the successful delivery and ongoing support of a complex University-wide system.

3. (Essential to the job)
Please share examples/instances from your previous roles where you worked within structured environments, and how do you approach using technical documentation in your daily work?

Throughout my career, I have worked within highly structured and process-driven environments, most notably in my previous role supporting the implementation of a University-wide ERP system. As Overall ERP Project Coordinator, I worked across HR, Payroll, and Finance, where adherence to established procedures, governance frameworks, and project methodologies is essential to ensure successful delivery.

My day-to-day work involves maintaining project plans, managing action logs, tracking risks and issues, and ensuring that activities are completed in line with agreed milestones and governance processes. I regularly coordinate project board meetings, document decisions and actions, and maintain a central SharePoint repository to ensure that project information is accurate, accessible, and version controlled. Working within this structured framework enables effective collaboration across multiple teams and ensures transparency and accountability throughout the project lifecycle.

Technical documentation forms a key part of my role, and I place great importance on ensuring that documentation is clear, accurate, and easy to follow. I routinely create and maintain user guides, process documents, testing scripts, meeting minutes, action logs, and video tutorials to support both project delivery and end-user adoption. For example, during the ERP implementation, I developed written and video-based training materials to help staff become familiar with the new system and reduce reliance on support requests.

I also use technical documentation to support troubleshooting and issue resolution. When investigating support tickets, I refer to existing documentation, system specifications, and process notes to diagnose problems and identify appropriate solutions. Where new issues arise, I ensure that lessons learned and resolutions are documented so that knowledge can be shared and similar issues can be resolved more efficiently in the future.

My approach to documentation is centred on accuracy, consistency, and continuous improvement. I recognise that maintaining comprehensive and up-to-date documentation is essential for knowledge sharing, supporting users with different levels of technical expertise, and ensuring that processes are repeatable and auditable within a structured environment.

4. (Essential to the job)
Please share examples/instances from your previous roles where you have gathered and interpreted customer requirements and translated them into practical solutions

In my previous role supporting the implementation of a University-wide ERP system, I have regularly been required to gather, interpret, and translate customer requirements into practical solutions that meet the needs of a diverse range of stakeholders across HR, Payroll, and Finance.

A key example of this has been working closely with end users and subject matter experts to understand their business processes and identify system requirements during the implementation phase. Through meetings, workshops, and day-to-day engagement with stakeholders, I gathered information on how teams currently operated and documented their requirements to ensure that the new system was configured to support their needs. I also captured suggestions and enhancement requests for future phases of the project, ensuring these were clearly documented and prioritised.

In addition, I have been responsible for supporting users following the system go-live. By monitoring support tickets and engaging directly with colleagues, I have identified recurring issues and areas where users required additional support. Rather than simply resolving individual queries, I developed practical solutions such as user guides, process documentation, and video tutorials to address common challenges and improve user understanding. This proactive approach helped increase system adoption and reduce the volume of repeat queries.

I have also translated business requirements into testing scenarios by writing and executing test scripts across multiple workstreams. This involved interpreting user requirements and ensuring that system functionality aligned with operational processes. Where issues or gaps were identified, I worked collaboratively with stakeholders, subject matter experts, and the system provider to agree appropriate solutions and ensure that business needs

were met.

These experiences have enabled me to develop strong analytical and communication skills, allowing me to understand customer requirements, challenge assumptions where necessary, and deliver practical, user-focused solutions that improve processes and support organisational objectives.

5. (Essential to the job)
Elaborate on your knowledge of finance system configurations, including user access rights, process workflows and reporting. Please share examples of how have you applied this knowledge in your previous roles.

I have developed a strong understanding of the finance system configuration, particularly in relation to user access management, workflow processes, and some reporting requirements.

I have been responsible for managing user access rights within the ERP system, including creating, assigning, and updating roles and profiles to ensure users have the appropriate permissions based on their responsibilities. This has required a thorough understanding of segregation of duties, security requirements, and the importance of maintaining accurate access controls to support both operational efficiency and compliance.

I have also worked closely with stakeholders to understand and document end-to-end process workflows within Finance. By engaging with users and subject matter experts, I have helped ensure that system processes and approvals reflect existing business requirements and support efficient ways of working. During testing activities, I translated these requirements into detailed test scripts to validate that workflows functioned correctly and met user expectations. Where issues or gaps were identified, I collaborated with stakeholders and the system provider to implement practical solutions and improvements.

In addition, I haven't spent much time working on reports as this was something that wasn't prioritised at my previous employment. That being said, I believe my knowledge and understanding of TechOne would give me a head start in beginning to learn and understand how reporting works, and how to produce report that are required by end users.

A practical example of applying this knowledge has been during the post-go-live support phase. I have monitored and triaged support tickets relating to finance processes, investigated issues, and resolved problems where possible without escalation. I have also worked closely with the system provider to ensure that more complex issues are addressed promptly. Alongside this, I have produced user guides and training materials to help colleagues understand finance processes and system functionality, supporting user adoption and promoting consistent ways of working.

These experiences have provided me with a solid understanding of finance system configuration and the importance of aligning user access, workflows, and reporting with business needs to ensure effective and secure system operation.

6. (Essential to the job)
How have you applied case and issue management techniques in your previous roles? Please share examples

I have applied case and issue management techniques to ensure incidents, queries, and system defects are handled efficiently and resolved in a timely manner. Acting as a first point of contact for users across HR, Payroll, and Finance, I follow a structured approach to logging, prioritising, investigating, and resolving issues while maintaining clear communication with stakeholders.

A key part of my role involved monitoring and triaging support tickets raised by the wider business. I assess and prioritise requests, investigate issues, and resolve problems where possible without escalation. For more complex cases, I work closely with subject matter experts and log tickets with the system provider to ensure issues are tracked and resolved promptly.

Following the ERP go-live, I managed a high volume of support requests relating to user access, workflows, and system functionality. By categorising issues, maintaining detailed records, and identifying recurring themes, I was able to resolve common problems efficiently and improve processes to prevent repeat incidents.

I have also applied issue management techniques during system testing by documenting defects, assessing their impact, and working with stakeholders and the supplier to implement and verify solutions. In addition, I have created user guides and video tutorials based on common queries and lessons learned, helping to improve user

understanding and reduce the number of repeat cases.

These experiences have strengthened my ability to manage competing priorities, maintain accurate records, and deliver a responsive, customer-focused support service.

7. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to work as part of a team, understanding team dynamics and showing a flexible approach to team delivery and achievement of team and individual objectives. Can you describe how you contribute to team success and adapt your approach to support team objectives?

Throughout my career, I have worked collaboratively within cross-functional teams and understand the importance of flexibility, communication, and supporting others to achieve shared objectives. In my previous role as Overall ERP Project Coordinator, I work closely with colleagues across HR, Payroll, Finance, IT, and external consultants to ensure the successful delivery of a University-wide ERP system.

Following my promotion, my remit expanded from coordinating the HR workstream to overseeing activities across Finance, HR, and Payroll. This required me to understand the priorities and challenges of different teams and adapt my approach to ensure effective coordination and delivery. I regularly facilitate meetings, maintain project plans, track actions, and work with stakeholders to resolve issues and manage dependencies, ensuring that everyone remains aligned on project objectives.

I contribute to team success by being proactive, organised, and willing to support colleagues wherever needed. For example, during testing and post-go-live activities, I assisted users with resolving issues, coordinated with subject matter experts and the system provider, and developed training materials and user guides to support wider teams. By sharing knowledge and maintaining open communication, I helped promote a collaborative approach and reduce the impact of issues on business operations.

I recognise that priorities can change and that different situations require different approaches. As a result, I have developed a flexible working style, enabling me to adapt to changing demands, take on additional responsibilities when required, and support both team and individual objectives. This has helped contribute to the successful implementation and ongoing support of a complex, organisation-wide system.

8. (Essential to the job)
Please share examples/instances from your previous roles where you were able to set and maintain self-determined deadlines aligned to meeting system and user needs. How do you prioritise your workload and ensure deadlines are met when supporting system and user needs?

In my previous role as Overall ERP Project Coordinator, I have regularly been required to set and manage self-determined deadlines while balancing project priorities with the needs of users across HR, Payroll, and Finance. Working in a fast-paced environment, I was responsible for ensuring that project activities, testing, support requests, and documentation are delivered within agreed timescales.

I prioritise my workload by assessing the urgency, impact, and dependencies of tasks. I maintain project plans, action logs, and trackers to monitor progress and ensure key milestones are achieved. For example, during critical phases of the ERP implementation and post-go-live support, I balanced day-to-day support ticket management with testing activities, meeting coordination, and the production of training materials. By organising my workload effectively and proactively managing competing priorities, I was able to ensure that both project deadlines and user needs were met.

I also monitored support tickets and prioritise issues based on their impact on business operations. Where possible, I resolve issues directly, while ensuring more complex cases are escalated and tracked through to completion. This approach enables me to provide a responsive service to users while maintaining progress against wider project objectives.

My ability to plan ahead, remain organised, and adapt to changing priorities has enabled me to consistently deliver high-quality outcomes and support the successful implementation and ongoing operation of a complex University-wide system.

9. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to operate within, and contribute positively towards, the maintenance of a welcoming and inclusive operational environment.

One way I contributed to inclusivity is by making project communication clear, structured, and accessible to all stakeholders. When organising project meetings, I ensure agendas and minutes are written in plain language and avoid unnecessary technical jargon, so that colleagues across HR, Payroll, Finance, and external suppliers can fully engage regardless of their technical background. I also make sure actions are clearly assigned and summarised, which helps ensure everyone has equal clarity and opportunity to contribute.

In coordinating system testing and user engagement, I actively supported colleagues who may be less confident with new systems. I took time to create step-by-step test scripts, provide user guides, and produce video tutorials to accommodate different learning styles. During user testing cycles, I encourage open feedback and make myself available to support individuals who may be hesitant to raise issues, ensuring their input is captured and valued.

I also played a key role in managing cross-department collaboration during project governance meetings. In these settings, I ensure all voices are heard by tracking actions and contributions across workstreams and following up with stakeholders who may not have had the opportunity to speak during meetings. This helps maintain balanced participation across departments and prevents more dominant voices from unintentionally overriding others.

Additionally, when managing support tickets and system issues, I adopt a patient and solutions-focused approach, particularly when working with users who may be frustrated or less familiar with the ERP system. I aim to resolve issues clearly and respectfully, and where escalation is required, I ensure communication remains constructive and non-blaming.

Overall, I contribute to an inclusive environment by promoting clarity, accessibility, and respectful communication across all levels of the project, ensuring that all stakeholders feel supported and able to contribute effectively.

Current/Most Recent Employer

Currently work at London School of Hygiene & Tropical Medicine: No	
Employer's Name: University of the Arts London	**Job Title:** Income Services Manager (Data and Operations)

Location: London	**Salary:** 45,000	**Start Date:** 07/2023	**Ongoing**
Employment Type: Other education institution in UK			

Brief Description of Duties: - Act as functional subject matter expert and primary liaison for the Student Systems team, identifying issues and gaps in SITS and Salesforce CRM, coordinating with developers to scope and implement fixes or new features, testing changes before release, and training the wider team on new functionality.

- Translate operational and compliance needs into practical system specifications, advising on configuration requirements and improving how financial data is captured and processed across student systems.

- Build and maintain analytical reporting models using data from student information systems, CRM and financial platforms, producing reports and trend analysis on income performance, debt patterns and enrolment risk for senior decision-making.

- Lead financial advisory and compliance operations across income services for a large, internationally diverse student population, providing authoritative guidance on UKVI regulatory requirements, fee obligations, and funding eligibility to students, sponsors, and internal stakeholders.

- Advise international students and sponsors on visa-related financial implications, ensuring fee arrangements comply with UKVI regulations and enrolment changes are accurately reflected in records.

- Advise on and support implementation of global sales tax configuration within student systems for online and low-residency courses, ensuring correct tax treatment is applied by jurisdiction.

- Assess and resolve complex third-party sponsorship and funding cases, evaluating eligibility against institutional policy and government guidelines, and providing clear written determinations to students and corporate clients.

- Manage contract staff across the full employment lifecycle, including recruitment, onboarding, performance management and contract completion.

Reasons For Leaving/ Wishing To Leave: finishing tenure	**Notice Period:** 1 week

Previous Employment

Employer's Name: University of Westminster, London	**Job Title:** Research Grants and Project Officer	
Location: London	**Start Date:** 08/2022	**End Date:** 06/2023

Brief Description of Duties: - Administered financial data within Agresso, including setting up new records, amending standing data and ensuring data was maintained accurately for audit and funder reporting purposes.

- Supported system and process documentation for grant administration, ensuring financial procedures were clearly recorded and kept up to date for Principal Investigators and finance colleagues.

- Worked within a structured, policy-driven environment, following technical documentation and compliance requirements closely when reconciling expenditure and validating data.

- Liaised with internal stakeholders and external suppliers to resolve case-by-case funding and procurement queries, applying consistent issue-resolution processes.

Reasons For Leaving: Contract Completed

1. (Essential to the job)
Can you describe your relevant professional qualifications or the experience you have gained that prepares you for this role? Please elaborate on your educational qualification and/or relevant experience with examples.

I hold a First Class BSc in Computer Science from the University of Westminster, where my modules covered data systems, programming and project management. This gave me a solid technical foundation that I've built on through nearly three years working directly with student finance and information systems at UAL, including SITS, Salesforce CRM and Gravity Forms.
A good example of how I've applied this is a Salesforce enquiry visibility issue I identified in late 2023, where a routing fault meant student emails were not reaching the correct teams across multiple service areas, not just Fees. I led the escalation with the Head of Student Enquiries and the Digital team, secured a workaround and then a permanent fix, and trained colleagues once it was resolved. I've also identified and helped resolve a data protection risk within how Salesforce surfaced contact records in search results, working with the Digital team to correct the configuration and reduce the chance of information being sent to the wrong recipient. I hold a PCI DSS certification and have been developing my knowledge of AI governance frameworks, which reflects my ongoing interest in technical and regulatory areas relevant to systems and data work.

2. (Essential to the job)
Describe your experience in delivering first-line operational IT support, particularly within a higher education environment. Please share examples from your previous roles to support your statement.

In my role at UAL I provide first-line support on student finance systems while acting as bridge between income services(tuition fees) and systems development teams including SITS, Salesforce CRM and Gravity Forms, to a large and diverse user base of staff, students and sponsors. When something goes wrong, I work out whether I can resolve it directly or whether it needs escalating, and I see it through to resolution rather than handing it off and moving on.
One example is during a Gravity Forms go-live at the start of an enrolment peak in September 2025. I'd recommended redirects from the legacy form links to the new ones and helped test the change beforehand, but spotted a fault shortly after launch and escalated it immediately to the Digital team. That early catch prevented an estimated eighty to a hundred student emails per day from being lost during one of the busiest periods of the year. Around the same time, I also found that filters were blocking enrolment queue emails across colleges, which I escalated and tested once the Digital team had fixed it. I also identified issues within SITS, including small input inconsistencies in pasted student ID data that were slowing down mass processing, and worked with colleagues to fix that, then made sure the wider team understood the change.

3. (Essential to the job)
Please share examples/instances from your previous roles where you worked within structured environments, and how do you approach using technical documentation in your daily work?

Both my current and previous roles have required me to work to clearly defined institutional policies and regulatory frameworks. At UAL, decisions around fee compliance, sponsorship eligibility and UKVI regulations all have to follow institutional policy and government guidance precisely, and I keep records of my reasoning in written determinations that other staff and sponsors rely on.
In my previous role at the University of Westminster, I worked closely with Agresso records and financial documentation to reconcile expenditure and keep audit-ready records, which meant following financial procedures and technical guidance closely rather than relying on memory or shortcuts. My approach to technical documentation is to treat it as the source of truth, refer back to it when something is unclear, and flag it for updating when I notice it no longer matches what's happening in practice, which is something I've done several times when raising system issues at UAL.

4. (Essential to the job)
Please share examples/instances from your previous roles where you have gathered and interpreted customer requirements and translated them into practical solutions

A clear example of this is the enrolment queue visibility issue I identified in mid 2025, just as the busiest period of the year was starting. Colleagues across several colleges were reporting that certain emails seemed to be going missing, but nobody had pinned down why. I worked with the Senior Academic Registry Team and the Digital team to trace it back to filters that were blocking the relevant emails, and once it was fixed, I tested it to confirm visibility had actually been restored across all the affected colleges, not just reported as fixed.
I take a similar approach with sponsors and corporate clients, where I have to interpret what they actually need from a funding or compliance perspective, often from a fairly general query, and turn that into a clear written determination they can act on. In both cases the pattern is the same: listen past the initial description of the problem, find the actual cause, and make sure the solution genuinely addresses it rather than just the symptom that was reported.

5. (Essential to the job)
Elaborate on your knowledge of finance system configurations, including user access rights, process workflows and reporting. Please share examples of how have you applied this knowledge in your previous roles.

In my current role I act as the subject matter expert for student finance systems, advising on configuration requirements and how data should be captured and processed within SITS and CRM. I've supported the rollout of global sales tax configuration for online and low-residency courses, making sure the right tax treatment applies depending on jurisdiction, which required a solid understanding of the system's configuration logic and how it sat within wider financial workflows.
I'm currently working on a fee assurance issue for UAL's Flexi and Online courses, where I identified a gap in how the system handles new units or modules: they can be added without automatic fee charging triggering unless someone manually flags it. I'm working through a one-off recalculation and debt report to catch any charges that may have been missed, and proposing an automated notification so the Fees team is alerted whenever new units are added going forward, protecting income that would otherwise be lost. I also build reporting models that pull from student systems, CRM and financial platforms to track income performance, debt patterns and enrolment risk, which depends on understanding exactly how data moves through configuration, workflow approval, and into the reports senior leadership rely on.

6. (Essential to the job)
How have you applied case and issue management techniques in your previous roles? Please share examples

I deal with case management directly through sponsorship and funding cases at UAL, where I assess each case against institutional policy and government guidelines and provide a written determination explaining the outcome.
I've applied a similar structured approach to system issues. When I identified the Salesforce enquiry visibility problem in late 2023, I didn't just raise it and step back. I led the escalation with the Head of Student Enquiries and the Digital team, helped get a temporary workaround in place, then followed it through to a permanent fix, tested it with the affected teams including Admissions and Funding, and trained my own team on the change. I followed the same end-to-end approach with a data protection risk I identified in how Salesforce displayed certain contact records, escalating it to the Digital team, confirming the fix actually resolved the risk, and flagging it to my line manager for visibility. In each case, I track the issue from identification through to confirmed resolution rather than treating it as closed once it's been handed off.

7. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to work as part of a team, understanding team dynamics and showing a flexible approach to team delivery and achievement of team and individual objectives. Can you describe how you contribute to team success and adapt your approach to support team objectives?

I work across several teams day to day, including the Student Systems and Digital teams, finance colleagues, and contract staff that I manage directly. I've found the same approach doesn't work for every team, so I try to read what a particular team or colleague actually needs from me.
A good example is the enrolment queue and forms go-live issues during last year's peak enrolment period. Those involved coordinating between myself, the Digital team, Academic Registry colleagues, and student-facing teams across different colleges, each with different priorities and technical familiarity. I made sure the Digital team had clear, specific information to act on, then made sure operational colleagues understood what had changed and felt confident using it, which meant adjusting how I explained things depending on who I was speaking to. I also train and supervise temporary administrators during peak periods, which has taught me a lot about adapting my approach to people who are newer to the systems and need more structured support to get up to speed quickly.

8. (Essential to the job)
Please share examples/instances from your previous roles where you were able to set and maintain self-determined deadlines aligned to meeting system and user needs. How do you prioritise your workload and ensure deadlines are met when supporting system and user needs?

A lot of my work doesn't come with externally imposed deadlines, so I have to judge urgency myself based on impact to users and the system. Similar to previous example, When I spotted a fault shortly after the Gravity Forms go-live in September 2025, right at the start of enrolment peak, I escalated it immediately because I knew the cost of delay was measured in missed student emails every day, rather than treating it as routine. By contrast, the Flexi and Online fee assurance work I'm currently doing is important but not urgent in the same way, so I've planned it as a structured piece of work, starting with a one-off recalculation to catch any missed charges before building a longer-term automated fix.

I generally prioritise by thinking about who is affected, how time-sensitive the impact is, and what else depends on it being resolved, then set my own timeline accordingly. I also build in proper testing time even under pressure to move fast, since I'd rather take slightly longer and confirm a fix actually works than roll something out and have it cause further problems.

9. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to operate within, and contribute positively towards, the maintenance of a welcoming and inclusive operational environment.

UAL has an internationally diverse student population, and a significant part of my role involves supporting students and sponsors from a wide range of backgrounds, often navigating complex visa, funding or financial circumstances that can be stressful for them. I make sure I communicate clearly and patiently, take the time to understand someone's situation before responding, and treat every query with the same care regardless of how complex or routine it is.
Within my own team, we hire temporary staff members to support student and staff during enrolment periods, I try to create an environment where people feel comfortable raising issues or asking questions, including when I'm training colleagues or temporary staff on system changes, since I know not everyone learns the same way or feels confident speaking up straight away. I make a point of properly supporting temporary administrators through onboarding rather than leaving them to work things out alone, so they feel part of the team from early on rather than peripheral to it.

1. (Essential to the job)
Can you describe your relevant professional qualifications or the experience you have gained that prepares you for this role? Please elaborate on your educational qualification and/or relevant experience with examples.

My foundation for this role comes from a blend of formal accounting qualifications and hands-on systems experience. I am ACCA part-qualified and hold a Master's degree in Accounting and Business Management (Grade A) from Brunel University, alongside a Bachelor's in Tax Accounting. This academic background gives me a strong grasp of core finance processes, which I find essential when supporting users and understanding the reasoning behind system configurations, data controls, and approval workflows.
In terms of practical experience, I have spent the last several years working in Higher Education finance teams, including roles at Queen Mary University, Imperial College, and the University of Roehampton. In these positions, I acted as a super-user for core HE systems like Agresso (ABW) and Worktribe. I regularly provided first-line support to colleagues, triaging system issues, managing user access, and ensuring data moved correctly through approval workflows. For example, at Imperial College, I was the main point of contact for setting up new sponsors and activating grants on the general ledger, which required me to troubleshoot user errors, update master data, and resolve system queries directly.
What really prepares me for the technical and upgrade side of this role is my background as a Finance Systems Project Lead and QA Specialist. In this capacity, I was directly involved in system change and development projects. I led the preparation of test scripts for new financial software releases, managed issue tracking with providers, and created both technical documentation and training materials for end-users. I also gained a solid working knowledge of how finance systems integrate with other IT platforms and handle data exchange.
Ultimately, my combination of accounting knowledge, Higher Education sector experience, and dedicated IT systems support gives me the exact mix of skills needed to support the finance systems and drive continuous improvement within your team.

2. (Essential to the job)
Describe your experience in delivering first-line operational IT support, particularly within a higher education environment. Please share examples from your previous roles to support your statement.

In my previous roles across the Higher Education sector, being the first point of contact for finance system issues was just a natural part of the job. Because I was the one actually using the systems daily to process complex finance tasks, colleagues naturally came to me when things went wrong before they ever thought to contact the central IT helpdesk.
At Imperial College, I worked closely with both the Research Office and Central Finance. A big part of my day involved troubleshooting issues when academics or departmental admins couldn't get their grants set up correctly on the general ledger. If a user was getting an error message when trying to set up a new sponsor or activate a budget, I would look into it. I'd check if it was a master data issue, a permissions problem, or a process error, fix the erroneous entries directly in the system, and then explain to the user what went wrong so they could avoid it next time.
At the University of Roehampton, I was the designated 'super-user' for our Agresso finance system. This meant I handled the bulk of the first-line IT support for my department. If someone couldn't log in, needed their access rights changed, or was stuck because a document was caught in an approval workflow, they came to me. I spent a lot of time resetting workflows, updating user permissions, and doing basic troubleshooting. I also ended up creating quick reference guides and training colleagues on how to use the system properly, which drastically reduced the number of basic support queries I was getting.
For me, providing first-line support in a university environment is really about translation. The central IT teams often speak in technical terms, while the finance users and academics just want to know how to post a journal or get a payment approved. My strength has always been sitting in the middle—understanding the accounting reason why the system needs to be set up a certain way, while having the technical patience to walk the user through fixing the issue.

3. (Essential to the job)
Please share examples/instances from your previous roles where you worked within structured environments, and how do you approach using technical documentation in your daily work?

Working in Higher Education finance, particularly at institutions like Imperial College and the University of Roehampton, means working in highly structured environments by default. University finance teams are bound by strict financial regulations, rigorous audit requirements, and specific compliance rules for external research funders. You can't just bypass a process because it's faster; every action has to follow the approved workflow. For example, at Imperial, setting up a new grant on the general ledger required strict adherence to both the university's financial policies and the specific sponsor's rules. The environment demanded absolute precision, and there was zero tolerance for "working around" the system.

Similarly, my earlier role as a Finance Systems QA Lead was inherently structured. Software testing and deployment rely entirely on structured methodologies, where every system change has to be documented, tested against specific criteria, and formally signed off before going live.
When it comes to technical documentation, I treat it as the single source of truth, but my approach to using it is very practical. If I'm troubleshooting a system issue or a broken approval workflow, my first step is always to consult the technical documentation to understand how the system is supposed to behave. I check the system configurations, data flow maps, or vendor manuals to determine if the issue is a user error, a training gap, or an actual system bug.
However, I also know that technical documentation can sometimes be too dense for everyday users, or it can easily become outdated after a system upgrade. At Roehampton, when I was acting as the Agresso super-user, I didn't just rely on the central IT manuals. I actively read through the technical release notes provided during system patches, and then I translated that technical information into practical, easy-to-follow quick reference guides for my colleagues. If I noticed that a process had changed but the official documentation hadn't been updated, I made it a point to flag it and help revise the materials. For me, technical documentation isn't just something you read once; it's a living tool that needs to be actively used, verified, and kept accurate to truly support the team.

4. (Essential to the job)
Please share examples/instances from your previous roles where you have gathered and interpreted customer requirements and translated them into practical solutions

In my previous roles, my "customers" were rarely external clients; they were usually academics, researchers, or internal department heads. They knew exactly what they needed to achieve for their projects, but they rarely understood the technical intricacies of the finance system. My job was always to bridge that gap.
A great example of this was during my time at Imperial College. Researchers would frequently come to me needing to set up complex, multi-year grants. They would often hand me a lengthy funding agreement from a research council or charity and essentially say, "I need to be able to spend this money according to these rules." They didn't know what a general ledger code was, how cost centres worked, or how the system's approval workflows needed to be configured.
I would sit down with them to gather their practical requirements. I'd interpret the financial and compliance rules from their funding agreement and translate them into tangible system actions. For instance, if a funder required that all equipment purchases over a certain threshold needed secondary approval, I would translate that business rule into a practical solution by configuring a specific approval workflow in the system, setting up the correct budget codes, and restricting certain transaction types. I essentially took their non-technical request and built a system configuration that kept them compliant without slowing them down.
I also did a lot of this when I was working as a Finance Systems Project Lead at SG Group. When we were developing new financial software, the end-users (the accounting team) knew what they wanted the system to do, but they couldn't write the technical specifications. I ran sessions to gather their requirements. For example, they needed a more efficient way to handle month-end accruals. I took that requirement, mapped out the technical data flow, and translated it into a practical solution by designing the automated journal templates, configuring the system workflows, and writing the test scripts to ensure it actually worked the way they needed it to.
Ultimately, my approach to gathering requirements is to listen to what the user is actually trying to achieve, figure out the technical or financial rules that apply to that goal, and then configure the system to make their daily work easier while ensuring the finance team remains fully compliant.

5. (Essential to the job)
Elaborate on your knowledge of finance system configurations, including user access rights, process workflows and reporting. Please share examples of how have you applied this knowledge in your previous roles.

My knowledge of finance system configurations comes from both using systems like Agresso daily and actually building and testing them during my time as a Systems QA Lead.
For user access rights, I always focus on strict financial controls. At the University of Roehampton, I managed Agresso access by setting up role-based profiles to ensure segregation of duties. I made sure the person raising a purchase order couldn't also approve it, and I configured their financial approval limits to match university policy.
For process workflows, at Imperial College, I managed the routing rules for project spending. If a document got stuck in the approval chain, I knew how to look at the backend workflow engine to see if it stopped because of a missing cost centre or an exceeded financial threshold. I could then adjust the configuration to get the workflow moving again.
On the reporting side, I've configured system parameters to automate operational reports. At SG Group and Roehampton, I set up the underlying data queries and templates for P&L, cash flow, and aged debtor reports so the team could generate them instantly without manual Excel manipulation.

Ultimately, when a user logs an issue saying they can't approve an invoice or a report is pulling the wrong data, I don't just guess. I know exactly where to look in the access profiles, workflow rules, or report parameters to find the root cause and fix it.

6. (Essential to the job)
How have you applied case and issue management techniques in your previous roles? Please share examples

In my Higher Education roles, managing system issues was a daily routine. When a user reported a problem in Agresso or Worktribe, my first step was always to triage it. I'd quickly assess whether it was a simple user error, a workflow block, or an actual system bug.
If I could resolve it locally like fixing a stuck approval or updating master data, I'd do it immediately and close the query. If it was a deeper system issue, I would log it in our tracking system and escalate it to Central IT or the software vendor. When escalating, I always made sure to provide detailed notes, steps to reproduce the error, and the business impact, which helped the technical teams resolve it much faster.
I also used formal case management techniques as a Finance Systems QA Lead at SG Group. When testing new software, I logged every defect into a case management system, prioritized them based on severity, and tracked them through to resolution. Once the developers deployed a fix, I retested it and formally closed the ticket.
Ultimately, my approach is about clear documentation, prioritizing by business impact, and following through until the user's issue is completely resolved.

7. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to work as part of a team, understanding team dynamics and showing a flexible approach to team delivery and achievement of team and individual objectives. Can you describe how you contribute to team success and adapt your approach to support team objectives?

In my previous roles, especially in busy Higher Education environments like Imperial College and the University of Roehampton, I've learned that effective teamwork is really about reading the room and stepping in where the pressure is highest. Team dynamics constantly shift, particularly during peak periods like year-end or major system updates, and I always try to be the flexible team member who adapts to what's needed most in that moment.
For example, at Imperial College, I supported the Research Grants Manager and the wider team. During a particularly busy period with a massive influx of new grant setups, I noticed some colleagues were getting bogged down by technical system errors, which was threatening our team's overall processing targets. I adapted my approach by temporarily taking on the bulk of the system troubleshooting and IT escalations. By absorbing that technical friction, I freed the rest of the team to focus on their core processing goals, which allowed us to hit our collective deadlines without anyone burning out.
I also apply this understanding of team dynamics when working with and training others. When I supervised a team of six at SG Group, I quickly realized that everyone has different working styles and strengths. Some were highly technical but struggled with end-user communication, while others were great with people but needed more system training. I adapted my approach by pairing team members up for peer support and tailoring my coaching to their individual needs, rather than using a one-size-fits-all method.
Ultimately, I contribute to team success by being approachable, putting our shared objectives above a rigid job description, and always being willing to pivot and help a colleague who is struggling to meet a deadline.

8. (Essential to the job)
Please share examples/instances from your previous roles where you were able to set and maintain self-determined deadlines aligned to meeting system and user needs. How do you prioritise your workload and ensure deadlines are met when supporting system and user needs?

Working in busy Higher Education environments like Imperial College and the University of Roehampton meant I constantly had to balance reactive user support with proactive, deadline-driven system tasks. I had strict, self-determined deadlines for things like month-end reporting, system reconciliations, and preparing test scripts, but I also had a live queue of user queries coming in.
I prioritized my workload by triaging based on actual business impact. If a user's issue was blocking a critical payment to a supplier or preventing a researcher from submitting a time-sensitive grant, I made that my immediate priority. For less urgent "how-to" questions or routine access requests, I batched them together and tackled them during specific time blocks I dedicated to user support, rather than letting them interrupt my system work all day.
To ensure I met my own system deadlines without neglecting the users, I relied heavily on proactive communication. If a complex system issue was going to delay my month-end batch or testing schedule, I would immediately tell the user: "I'm investigating this, but I need to finish the month-end run first. I will give you an

update by 3 PM." This managed their expectations while protecting my own deadlines.
For larger system projects, like the software deployments I managed at SG Group, I set my own internal milestones for writing and executing test scripts. I didn't wait for a manager to chase me; I mapped out what needed to be done each day to ensure the upgrade went live on time. Ultimately, it’s about being highly organized, communicating transparently, and knowing when to fix an issue immediately versus when to schedule it.

9. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to operate within, and contribute positively towards, the maintenance of a welcoming and inclusive operational environment.

In my previous roles in Higher Education, I’ve always believed that a welcoming and inclusive environment starts with how you treat people when they are struggling, frustrated, or asking for help.
When I was acting as the first-line system support and "super-user" for Agresso at the University of Roehampton, users would often reach out feeling stressed or even embarrassed because they couldn't figure out the finance system. I made it a strict personal rule to never make anyone feel silly for not knowing how the software worked. I would patiently walk them through the solution, adapt my language to avoid technical jargon, and ensure they felt confident and respected. In fact, I previously won a "Best Trainer" award specifically because I focused on making complex financial systems accessible and approachable for everyone, regardless of their technical background or seniority.
On a broader team level, working in universities like Imperial College and QMUL means collaborating with an incredibly diverse mix of people—from international researchers and senior academics to administrative and finance staff. I always made a conscious effort to ensure that in meetings or when rolling out new system processes, every voice was heard. If I noticed a quieter team member or someone from a non-finance background being talked over, I would actively invite their perspective.
When I supervised a team of six at SG Group, I focused heavily on team dynamics. I made sure we recognized our diverse strengths and created a culture where people felt psychologically safe. For example, if a system error occurred, I encouraged the team to openly discuss what went wrong without fear of blame, so we could fix the process together rather than hiding mistakes.
For me, maintaining an inclusive operational environment means ensuring that whether someone is a senior professor or a junior administrator, they feel equally valued, supported, and comfortable asking for help. I know LSHTM highly values this kind of culture, and it is an environment where I naturally thrive and actively contribute.

Current/Most Recent Employer

Currently work at London School of Hygiene & Tropical Medicine: Yes			
Employer's Name: London School of Hygiene and Tropical Medicine		**Job Title:** IT Service Desk Analyst	
Location: Keppel Street	**Salary:** 35000	**Start Date:** 11/2025	**Ongoing**

Brief Description of Duties: Provide first-line IT support to staff and students, visitors and contractors acting as the primary point of contact for IT requests, queries, and technical issues.

Deliver support through multiple channels, including the walk-up Service Desk, telephone support, and the online self-service portal.

Log, track, and manage incidents and service requests using an IT Service Management (ITSM) system.

Maintain and contribute to the shared knowledge base, ensuring accurate documentation and efficient issue resolution.

Carry out device asset audits, track equipment, send reminders to users for device collection and returns, and maintain accurate asset records.

Work flexible shifts between 8:30am and 5:30pm, with occasional rotations to other IT support functions and involvement in IT projects as required.

Reasons For Leaving/ Wishing To Leave: Promotional Opportunity	**Notice Period:** Immediate start

Previous Employment

Employer's Name: The Cyber Helpline, UK	**Job Title:** Helpline Responder (Volunteering)	
Location: Remote (UK)	**Start Date:** 12/2025	**Ongoing**

Brief Description of Duties: Supported individuals through The Cyber Helpline, a UK charity providing free, independent support to victims of cybercrime and online harm, helping them regain control and stay safe online.

Provided guidance and support to individuals affected by cyber incidents, including compromised accounts, online harassment, identity theft, social media account breaches, ransomware attacks, sextortion, online blackmail, and other forms of cyber-enabled abuse.

Managed cases using ZenDesk, creating, updating, tracking, and escalating support tickets while maintaining accurate records of incidents and actions taken.

Conducted phone and online consultations with victims, gathering information about incidents, assessing risks, and directing individuals to appropriate support services, law enforcement agencies, and safeguarding organisations when required.

Assisted users in securing their digital accounts by setting up Multi-Factor Authentication (MFA), passkeys, account recovery methods, and other security measures to prevent further compromise.

Provided clear, empathetic, and non-technical advice to cyber victims, reassuring individuals about the free support available through the charity and helping them understand the steps needed to recover from incidents.

Shared important reporting channels, contact details, and cyber safety resources, helping victims access additional support and report incidents to relevant organisations where appropriate.

Participating in intensive training programs, webinars, and knowledge-sharing sessions to stay up to date with emerging cyber threats, online safety practices, victim support techniques, and cybersecurity best practices.

Reasons For Leaving: This is volunteering role and I will continue this part time role.

Employer's Name: London School of Hygiene & tropical Medicine	**Job Title:** Information Security Officer (Intern)	
Location: Keppel Street	**Start Date:** 02/2024	**End Date:** 11/2024

Brief Description of Duties: Monitored and triaged security alerts from cybersecurity and antivirus tools, investigating suspicious activity and escalating issues when required.

Supported security operations by tracking threats, reviewing incident reports, and maintaining records of security events and actions taken.

Monitored network security, identified vulnerabilities, and helped improve security measures to reduce risks.

Worked with different departments to communicate security policies and delivered training to help staff understand safe technology practices.

Used the MetaCompliance platform to create and deliver cybersecurity awareness training for staff.

Conducted phishing awareness exercises and provided training to help employees better recognise suspicious emails.

Reviewed firewall and data encryption systems, and supported staff training on cybersecurity best practices to help protect company data.

Supported a penetration testing project with an external supplier, helping with supplier vetting, project coordination, scheduling, and communication between stakeholders.

Reasons For Leaving: Secondment/ internship opportunity

Employer's Name: London School of Hygiene & tropical Medicine	**Job Title:** Receptionist/ Security Officer	
Location: Tavistock Place (TP2)	**Start Date:** 05/2013	**End Date:** 11/2025
Brief Description of Duties: Welcomed students, staff, visitors, and external stakeholders, providing a professional and friendly front-of-house service. Managed visitor sign-in procedures, issued passes, and ensured compliance with school security and safeguarding policies. Delivered inductions and training sessions for new staff on fire safety, health and safety, and security procedures. Assisted with general administrative tasks, responded to enquiries, and supported the smooth day-to-day operation of the reception area.		
Reasons For Leaving: Interest and passion in IT so, joined IT for career progress and development		

Supporting Statements

(To enter scores use the "Selection Criteria" tab)

1. (Essential to the job) Can you describe your relevant professional qualifications or the experience you have gained that prepares you for this role? Please elaborate on your educational qualification and/or relevant experience with examples.
I hold a Master of Business Administration (MBA), which has provided me with a strong foundation in business management, problem-solving, and strategic decision-making. I am certified in ITIL, which has provided me with a solid foundation in digital product and service management. My combination of specialised information security training, including CompTIA CySA+, and hands-on experience has provided me with strong practical expertise in defending systems, networks, and endpoints, as well as detecting and triaging security alerts, investigating and analysing threats, managing incident response activities, and producing detailed security reports. This experience has equipped me to identify, contain, and respond to real-world cybersecurity threats effectively while supporting the overall security posture of an organisation. In addition to these certifications, I have pursued a range of cybersecurity and technology qualifications, including CompTIA Security+, Microsoft SC-900, Microsoft AZ-900, Microsoft AI-900, ISO 27001 Lead Implementer, ISO 27001 Lead Auditor, PRINCE2 and UK GDPR training. These certifications have provided me with a broad understanding of information security principles, governance frameworks, regulatory requirements, risk management, cloud security, artificial intelligence fundamentals, and industry best practices, enabling me to apply a well-rounded approach to cybersecurity and compliance challenges. My experience as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time (volunteer) where I regularly triage TechOne and other support requests, has strengthened my ability to gather user requirements, apply structured IT service management processes, and ensure timely resolution or escalation in line with service levels. My experience as an Information Security Officer (Intern) at LSHTM and a volunteer role with The Cyber Helpline has enabled me to develop practical cybersecurity skills in incident investigation, security monitoring, user support, and cyber threat awareness. These roles strengthened my ability to identify and respond to security issues, support secure IT operations, and communicate effectively with users, preparing me to contribute confidently to a cybersecurity-focused role.
2. (Essential to the job) Describe your experience in delivering first-line operational IT support, particularly within a higher education environment. Please share examples from your previous roles to support your statement.
I have over two years of hands-on experience working in the IT industry, including internships at LSHTM and Firebrand Training, where I gained practical experience in IT support, troubleshooting hardware, software, and security-related issues, and ensuring smooth day-to-day operations for users. During this time, I supported end users with basic network connectivity issues, security queries, and helped with IT onboarding activities, which strengthened my problem-solving skills and understanding of IT infrastructure.

I am currently working as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time (volunteer) where I provide first-line IT support to staff, students, visitors, and contractors, acting as the main point of contact for IT requests and technical issues. I deliver support through multiple channels including walk-up service, telephone, and the self-service portal. I log, track, and manage incidents and service requests using an ITSM system, ensuring accurate documentation and timely resolution or escalation. I also maintain and contribute to the knowledge base, carry out device asset audits, track IT equipment, and manage user reminders for device collection and returns, ensuring accurate asset records and efficient service delivery.

Additionally, I bring over 12 years of customer service and administration experience, which has strengthened my communication, interpersonal, and problem-solving skills. In these roles, I was responsible for handling customer inquiries, resolving issues efficiently, and maintaining high standards of service in fast-paced environments.

For example, during my time at Firebrand Training, I supported both technical and non-technical users by ensuring their queries related to IT services were resolved promptly and professionally, contributing to a high level of customer satisfaction. This combination of IT support and extensive customer service experience enables me to deliver effective, empathetic, and user-focused support across both technical and non-technical environments.

3. (Essential to the job)
Please share examples/instances from your previous roles where you worked within structured environments, and how do you approach using technical documentation in your daily work?

In my current role as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time (volunteer), I work within a structured IT service management environment, following documented procedures, SLAs, and security policies to ensure incidents are handled consistently and efficiently. For example, when resolving Microsoft 365 account issues or user access requests, I follow established troubleshooting guides and escalation processes to ensure the correct solution is applied, all relevant checks are completed, and actions are accurately recorded.

During my secondment as an Information Security Officer at LSHTM, I worked with security policies, incident response procedures, and compliance requirements, which reinforced the importance of working within defined processes and maintaining accurate documentation, particularly in security-related activities.

I regularly rely on knowledge base articles, SOPs, and technical documentation in my daily work to troubleshoot issues effectively and ensure consistency in resolution. I also contribute to improving documentation where I identify gaps or opportunities, helping to make support processes more efficient and accessible for the wider team.

4. (Essential to the job)
Please share examples/instances from your previous roles where you have gathered and interpreted customer requirements and translated them into practical solutions

Throughout my career, including over 12 years in customer service and my current role as Service Desk Analyst at LSHTM and Helpdesk Responder, part time (volunteer), I have regularly gathered customer requirements by asking clear questions, understanding the impact of the issue, and identifying the desired outcome before providing a solution.

For example, a user reported they were unable to access Microsoft 365 after changing devices. By discussing their working requirements and checking their account, I identified that the issue was related to Multi-Factor Authentication rather than their password. I guided the user through re-registering their MFA method, restored access, and documented the resolution for future reference. This approach ensured the user's needs were met quickly while following security procedures. My extensive customer service experience has helped me communicate effectively with users of all technical abilities, translate their concerns into practical technical solutions, and deliver a positive customer experience.

5. (Essential to the job)
Elaborate on your knowledge of finance system configurations, including user access rights, process workflows and reporting. Please share examples of how have you applied this knowledge in your previous roles.

While I have not been responsible for configuring finance systems directly, I have developed relevant experience working with finance-related requests through TechOne in my current role as a Service Desk Analyst at LSHTM. I regularly receive TechOne support tickets, where I triage requests, gather additional information from users to fully understand the issue, assess the priority and impact, and either resolve the request where possible or escalate it to the appropriate finance or technical team with all the relevant information. This ensures requests are

processed efficiently and without unnecessary delays.

I also manage user access requests, applying role-based permissions and ensuring access is granted or removed in line with organisational policies and security procedures. During my secondment as an Information Security Officer, I supported access reviews and ensured user permissions complied with security and governance requirements.

For example, when on boarding or off boarding staff, I verified approvals, provisioned or revoked system access, documented all changes for audit purposes, and ensured requests followed the correct workflow. My experience handling TechOne requests, user access, structured workflows, and accurate reporting has given me a solid understanding of how business and finance systems are supported, and I am confident I can quickly build on this knowledge in a finance systems role.

6. (Essential to the job)
How have you applied case and issue management techniques in your previous roles? Please share examples

In my role as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time at The Cyber Helpline, I apply case and issue management techniques every day by managing incidents and service requests from initial contact through to resolution. I prioritise cases based on impact and urgency, gather all relevant information, carry out troubleshooting, and keep users informed throughout the process. Where an issue cannot be resolved at first line, I ensure it is escalated to the appropriate team with clear documentation, troubleshooting steps already completed, and all supporting information to avoid delays.

For example, when handling TechOne support requests, I triage each case, collect additional details from the user, identify whether the issue relates to access, configuration, or system functionality, and either resolve it directly or escalate it to the relevant application support or finance team. I also monitor the progress of escalated cases, follow up where necessary, and confirm with the user that the issue has been resolved before closing the ticket. This structured approach has helped me consistently meet service levels, maintain accurate records, and deliver a high standard of customer service.

7. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to work as part of a team, understanding team dynamics and showing a flexible approach to team delivery and achievement of team and individual objectives. Can you describe how you contribute to team success and adapt your approach to support team objectives?

Throughout my career, including over 12 years in customer service and my current role as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time at The Cyber Helpline, I have always worked collaboratively to achieve both individual and team objectives. I understand the importance of sharing knowledge, supporting colleagues during busy periods, and maintaining clear communication to ensure users receive a consistent and efficient service.

In my current role, I work closely with user services team, audio visual team, application support, cybersecurity, and other specialist teams to resolve incidents that require cross-team collaboration. For example, I regularly triage complex support requests, gather all the necessary information, complete first-line troubleshooting, and ensure tickets are escalated with clear documentation, enabling the receiving team to resolve issues quickly. I also support colleagues by sharing knowledge and assisting with workload where required to help the team meet service level targets.

During my secondment as an Information Security Officer, I worked on several collaborative projects involving both internal stakeholders and external suppliers. One example was coordinating a penetration testing project with an external security provider. I worked with external IT teams to schedule testing, ensured the supplier had the required information and access, tracked progress, communicated updates to stakeholders, and supported the review of the findings to ensure remediation actions were completed. The project was delivered successfully through effective collaboration, planning, and communication between all parties.

I adapt my approach depending on team priorities and business needs, whether that means taking ownership of urgent tasks, supporting colleagues during high workloads, or working across departments to achieve shared objectives. I believe that being flexible, communicating openly, and maintaining a customer-focused mindset are key to delivering successful outcomes as part of a team.

8. (Essential to the job)
Please share examples/instances from your previous roles where you were able to set and maintain self-determined deadlines aligned to meeting system and user needs. How do you prioritise your workload and ensure deadlines are met when supporting system and user needs?

In my current role as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time at The Cyber Helpline, I manage a high volume of incidents and service requests while ensuring they are resolved within agreed service levels. I prioritise my workload by assessing the impact and urgency of each request, considering business needs, security risks, and system availability. I set personal deadlines to complete investigations, follow up with users, and progress tickets proactively rather than waiting until SLA deadlines are approaching.

For example, I regularly manage TechOne support requests alongside Microsoft 365, user access, and security-related incidents. I triage each request, gather any missing information early, resolve issues where possible, or escalate them promptly with complete documentation to avoid delays. I then monitor the progress of escalated cases and follow up with the relevant teams to ensure users receive timely updates and resolutions.

During my secondment as an Information Security Officer, I managed multiple security activities with competing priorities, including coordinating penetration testing, supporting vulnerability remediation, and responding to security incidents. I planned my work around agreed project milestones and organisational priorities, ensuring tasks were completed on time while adapting quickly when urgent security issues arose. My organised and proactive approach has enabled me to consistently meet deadlines, maintain high service standards, and support both system performance and user needs effectively.

9. (Essential to the job)
Please share examples/instances from your previous roles where you displayed your ability to operate within, and contribute positively towards, the maintenance of a welcoming and inclusive operational environment.

In my current role as a Service Desk Analyst at LSHTM and Helpdesk Responder, part time at The Cyber Helpline, I work in a user-focused environment where maintaining a respectful, supportive, and inclusive approach is essential. I interact daily with users from a wide range of technical backgrounds and ensure that my communication is clear, patient, and non-judgemental. I adapt my approach depending on the user's level of understanding, making sure everyone feels supported and comfortable when reporting issues.

For example, when assisting users who may be frustrated or unfamiliar with technical systems, I focus on active listening, reassurance, and explaining solutions in simple terms without jargon. This helps create a positive experience and encourages users to engage confidently with IT support.

During my secondment as an Information Security Officer, I also worked with cross-functional teams and external suppliers, where professionalism, respect, and collaboration were key to maintaining a positive working environment. I contributed by communicating clearly, respecting different viewpoints, and supporting constructive discussions when working on security improvements and project delivery.

Additionally, with over 12 years of customer service experience, I have developed a strong ability to work with diverse individuals in fast-paced environments. Throughout my career, I have consistently ensured that all customers are treated fairly and respectfully, regardless of their background or technical ability. This experience has helped me contribute positively to inclusive team environments where collaboration, empathy, and mutual respect are valued.
